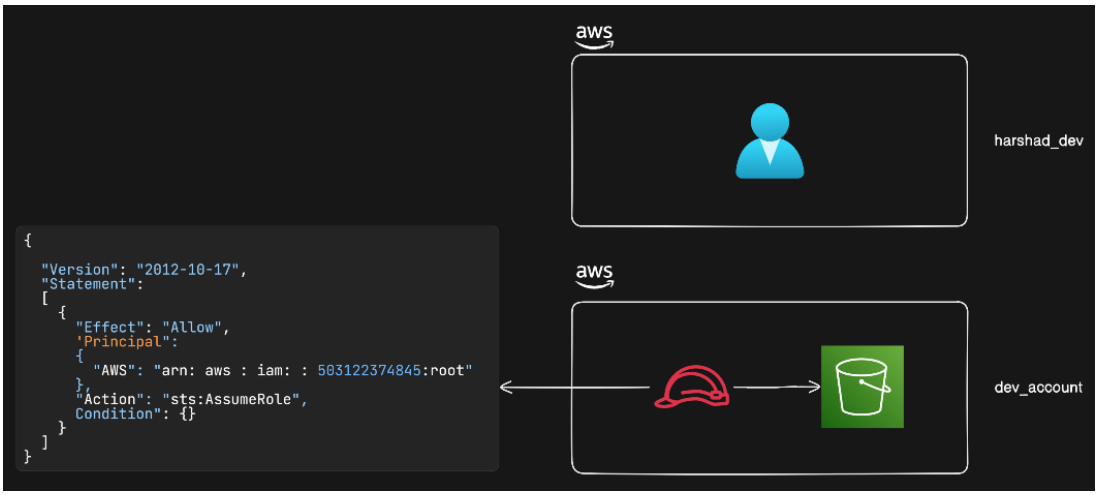
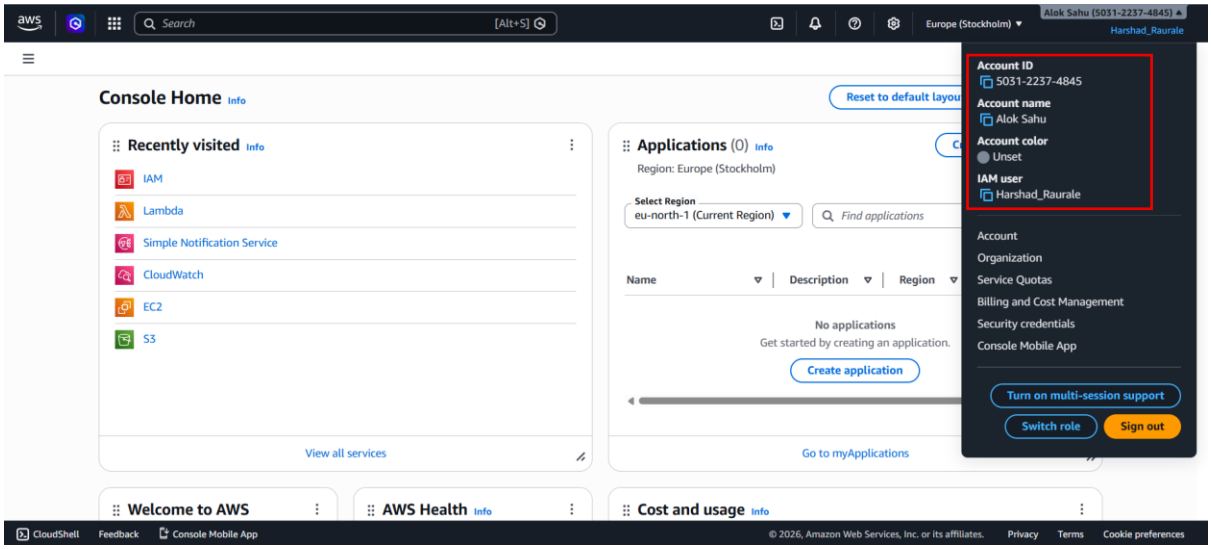
AWS Cross Account Access



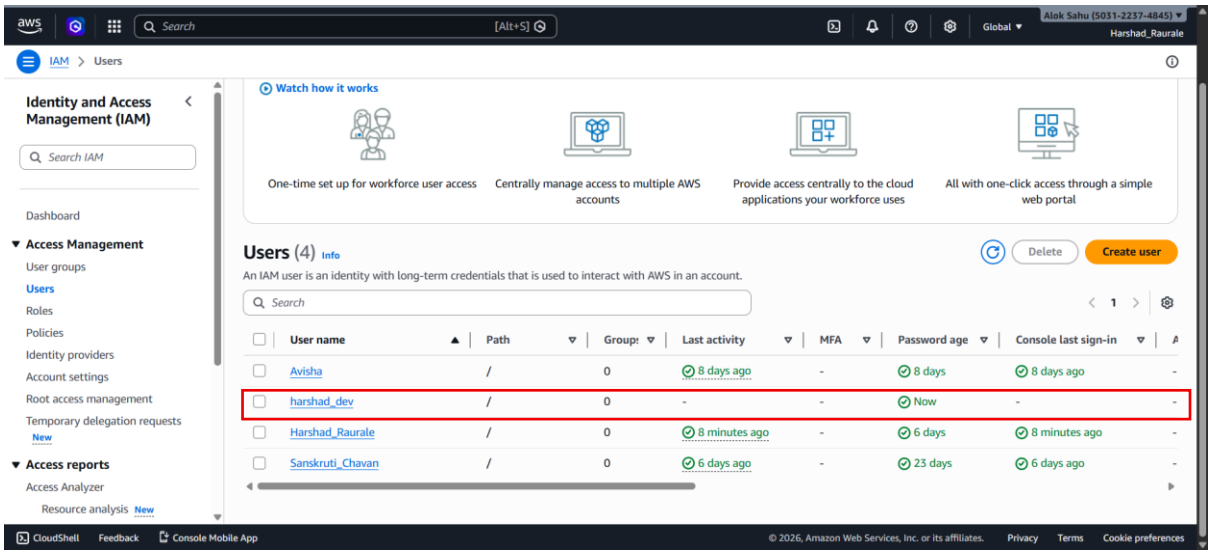
Here are the steps performed to set up cross-account access:

1. **Set up the Scenario:** Defined a **harshad_dev** (for the user) and a **Dev Account** (for resources).
2. **Create IAM User:** Created an *IAM user* named *harshad_dev* in the **Account**.
3. **Attach Policy to User:** Attached an **inline policy** to the *harshad_dev* user allowing it to assume roles using **AWS STS** (Security Token Service).
4. **Create IAM Role:** Created an *IAM role* named *S3FullAccessForharshad_dev* in the **dev_account**.
5. **Configure Trust Policy:** Defined a **trust policy** on the new role that explicitly trusts the **Account ID**.
6. **Attach Permissions to Role:** Attached the *AmazonS3FullAccess* policy to the role in the **Dev Account**.
7. **Switch Role:** Logged in as the *Harshad_dev* user and used the **Switch Role** feature in the console to assume the *S3 full access* role in the **dev_account**, granting access to the S3 bucket.

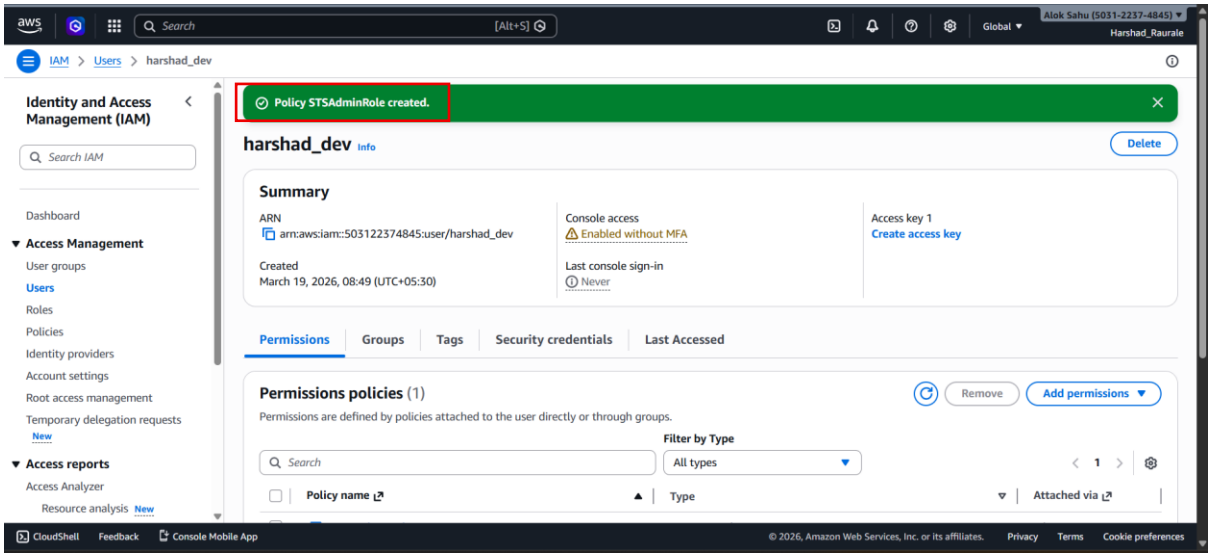
Consider this IAM user only as Root User for now



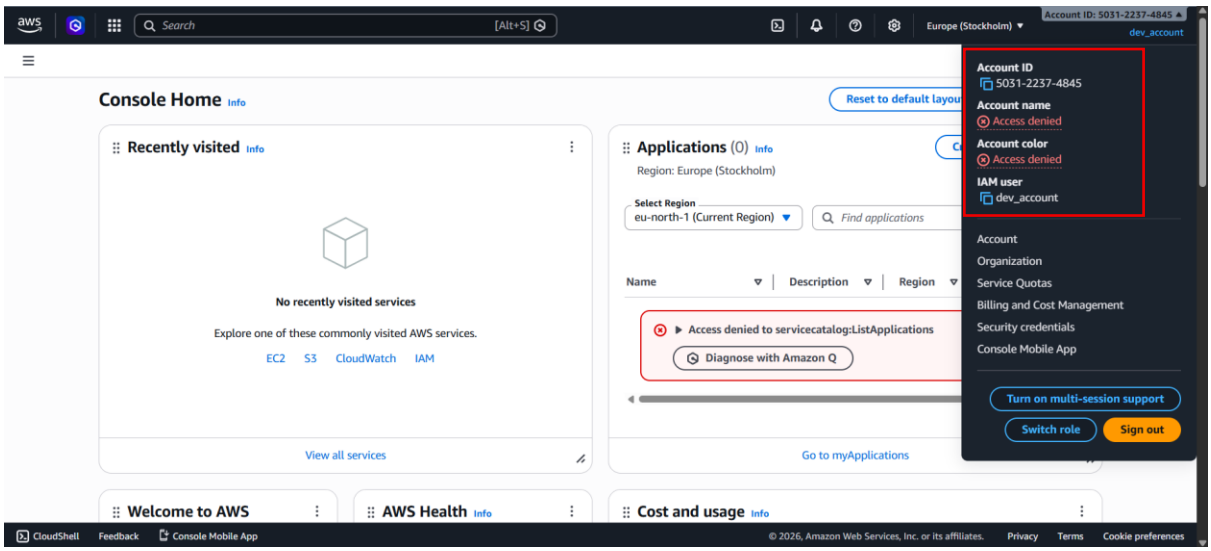
Created other user know as harshad_dev



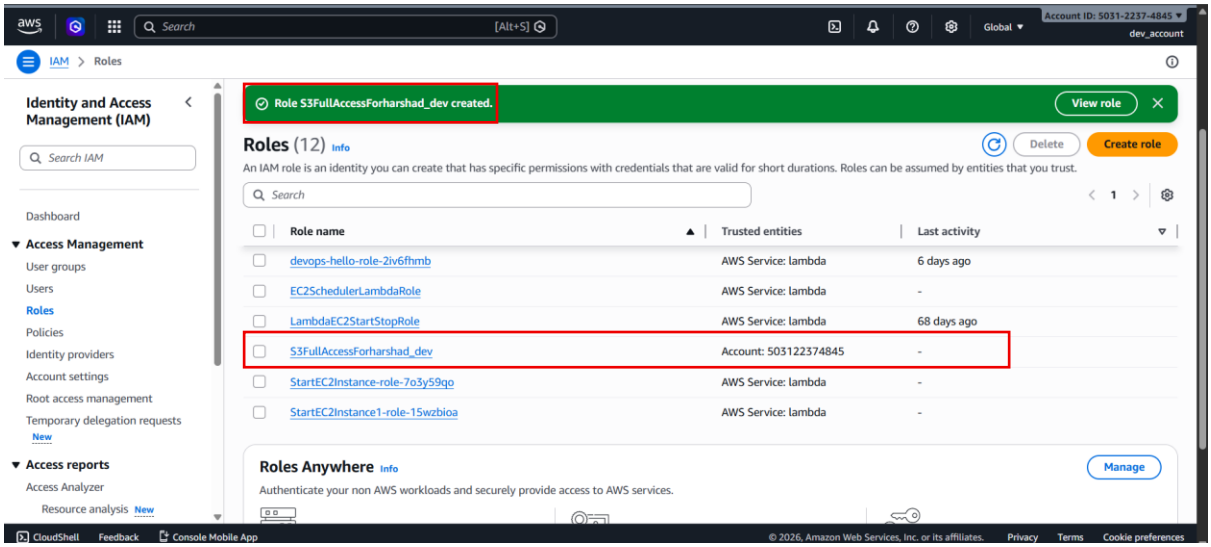
STS Inline policy create for harshad_dev IAM user



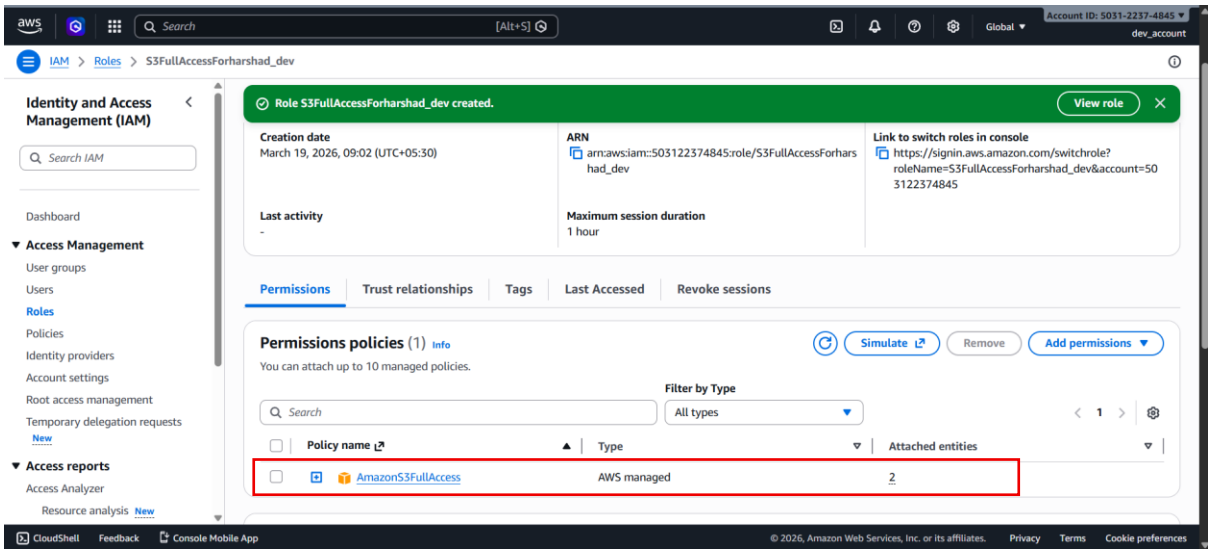
dev_account login



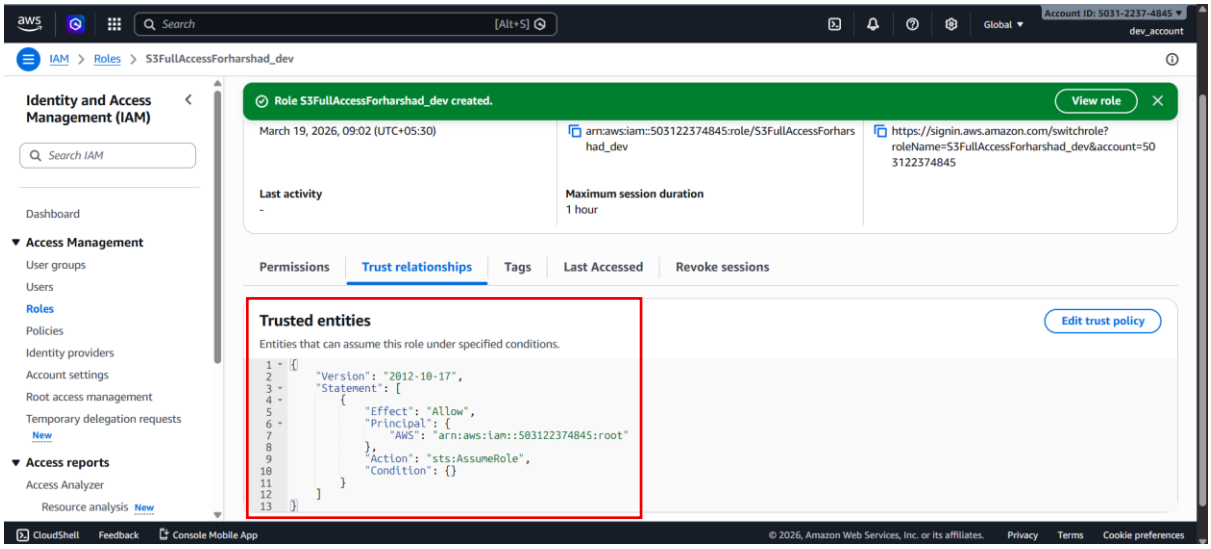
Role created



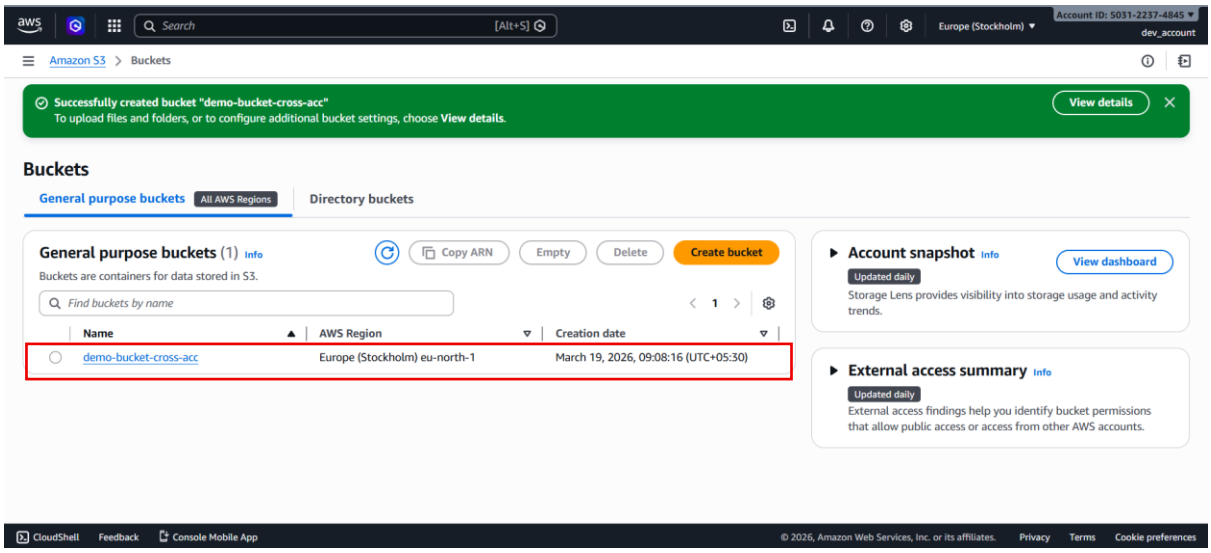
Permission policy



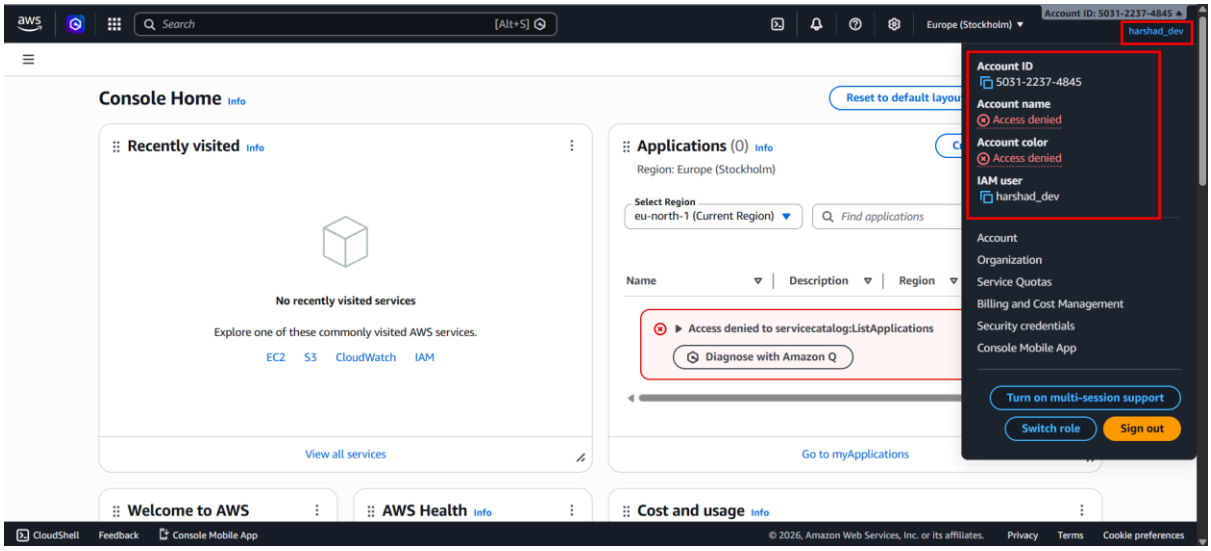
Trust policy between accounts



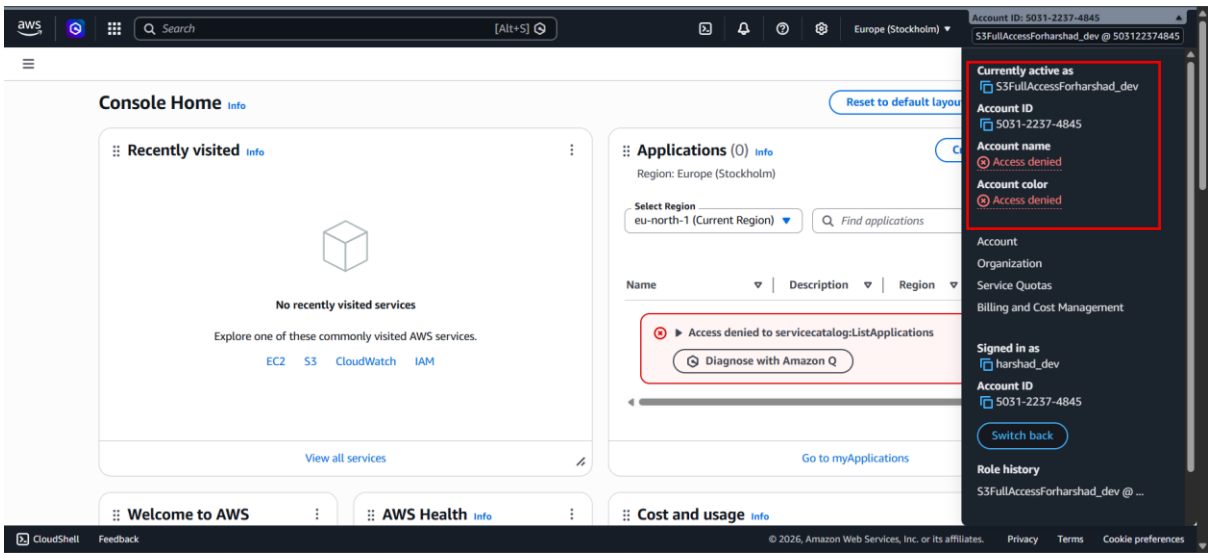
S3 bucket



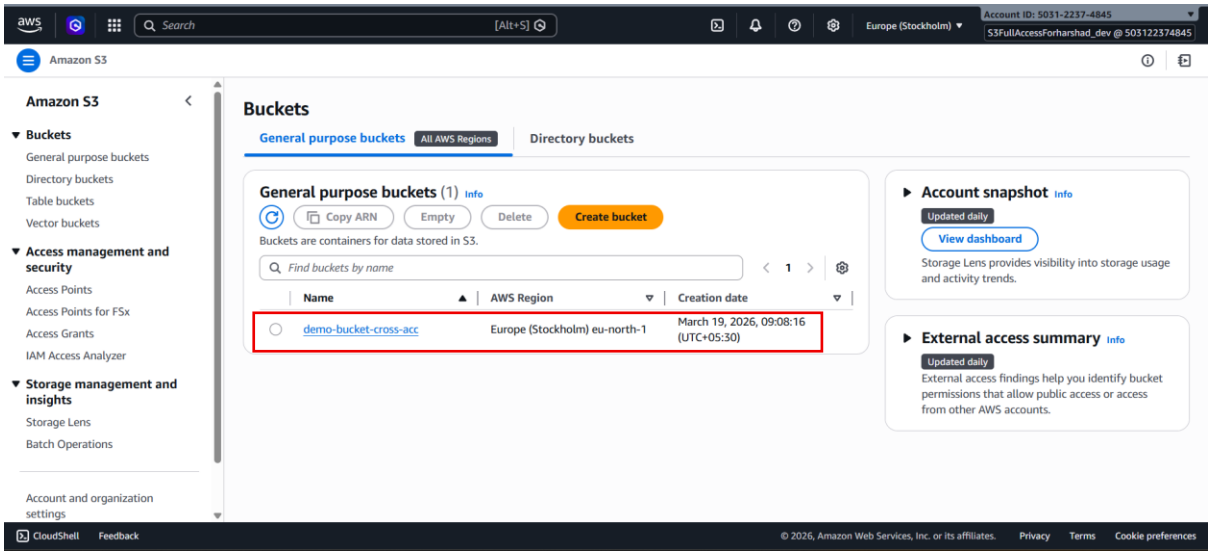
Harshad_dev account



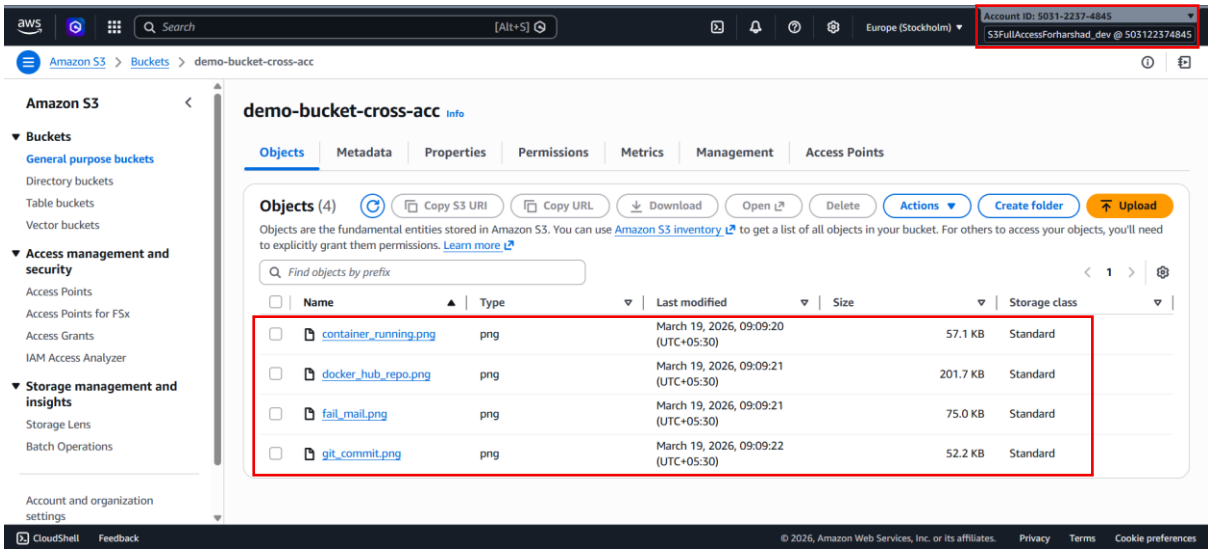
Switch role to S3FullAccessForharshad_dev



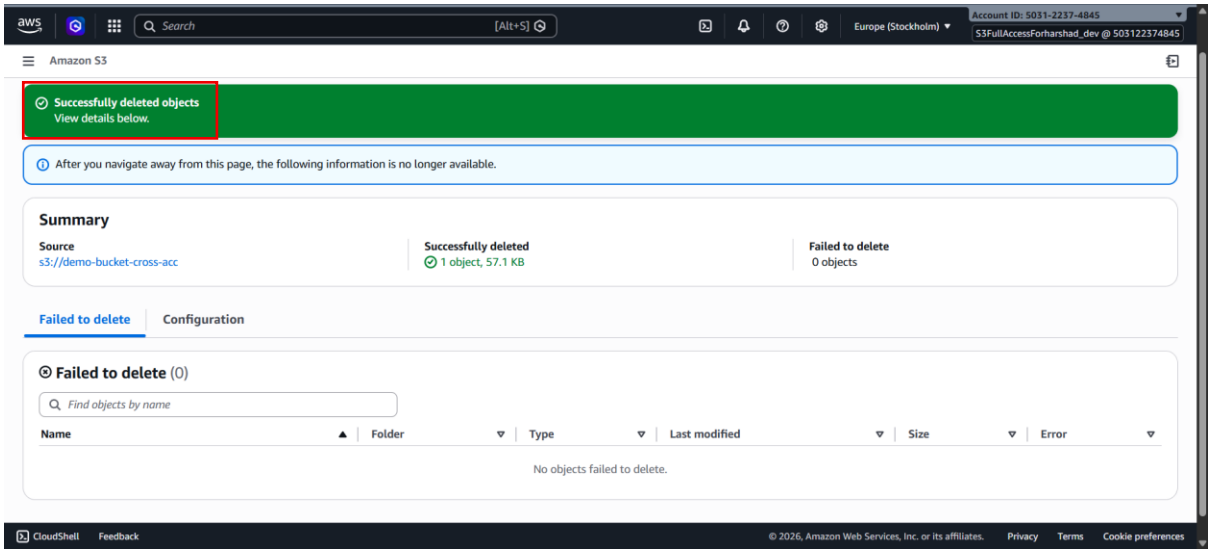
S3 Bucket

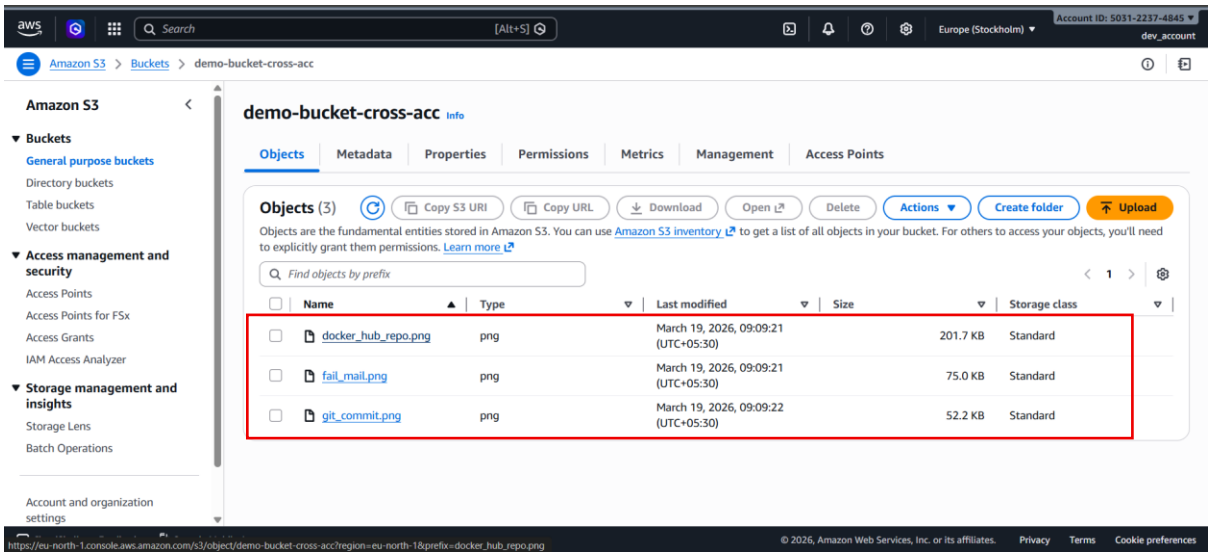


All the contains from the S3 Bucket



Deleted container_running.png from Harshad_dev





That container_running.png also deleted from dev_account
